Bunton's Lawn Seeds HAVE A GROWING REPUTATION

This lawn was sown with Bunton's Best Lawn Seed September 18, 1952.

This is the result after 63 days. Picture taken November 20, 1952.

This Louisville home gives pictorial evidence that Bunton's Seeds have a growing reputation. The owner of this lovely home used Bunton's Best Lawn Seed and Bunton's Lawn & Garden Grower. The soil was also treated with Krilium to a depth of three inches.

It has been claimed that Merion will stand closer cutting than Kentucky Blue Grass and is heat and drought resistant. Bunton's prefer to withhold full endorsement of this grass at its present high price per pound until more exhaustive tests have been made. At the present time Merion Blue Grass looks very promising. Bermuda Grass, commonly called wire grass, is a perennial that was introduced to this country from the warmer regions of the Old World. It became well established in the South as early as 1807, probably coming from either India or the Mediterranean region. Bermuda Grass is best adapted to the southern section of the United States. It forms a compact dense turf and usually stays green during the summer months when most of the native grasses of Kentucky are semi-dormant. Seeding Meadow and Pasture Crops

By E. J. Kinney, Ralph Kenney, and E. N. Fergus

Frequent failures in seeding pasture and meadow crops are extremely discouraging. While the chances of failure are greater in seeding pasture and meadow grasses and legumes than with most other farm crops, many failures are caused by poor judgment in seeding or an unwise choice of seeding practices. In general, farmers who choose the right crops, use good seed of adapted varieties, and follow dependable seeding practices have little difficulty in getting good stands of pasture and meadow crops.

Many failures occur, of course, because of low soil productivity. Attention should therefore be given during preparation of the seedbed to lime and fertilizer needs of the soil. In general the soil should be limed at the rate of 2 to 3 tons of ground limestone per acre unless the land has been adequately limed in the past 5 years. Low-phosphate land should be treated with 500 to 1,000 pounds of 20 per cent superphosphate per acre or the equivalent of other phosphate fertilizer. If rock phosphate is used, apply 1,000 to 1,500 pounds per acre and use in addition 200 pounds of 20 per cent superphosphate per acre as an aid in establishing the seedlings. Land low in available potash should receive at least 150 pounds of muriate of potash per acre.

When a complete fertilizer is used, an application of about 1,000 pounds per acre of a 4-12-8 mixed fertilizer will provide about the proper amount of plant food. On the many fields that have been limed and fertilized liberally in recent years, nitrogen may be the only element needed to enable young grass seedlings to become established. Plowing under a green-manure crop of cowpeas, soybeans, sweet clover, or other legume, or applying 100 to 150 pounds per acre of ammonium nitrate, or the equivalent of another fertilizer, at the time of seeding will help greatly to prevent seeding failures.

The drought has caused such serious pasture conditions that we asked our County Agricultural Agent to write a short article on pastures.

The balance of the information on this page is from University of Kentucky circular No. 402, by E. J. Kinney, Ralph Kenney and E. N. Fergus.

By Mr. Shirley W. Anderson
County Agricultural Agent

The extremely hot, dry weather during the summer and fall has resulted in severe damage to pastures and meadows in this area.

Many good old pastures have been burned out and most of the newer seedings have perished.

Certainly this condition must be corrected—preparations should be made now for this work.

First, determine plant food needs. This can be done by sampling and testing the soil. Apply the fertilizers needed and prepare the seed bed. Use a good grass-legume seed mixture adapted to your conditions and meeting your needs.

Manage the pastures properly—control the grazing—don't damage the stand and yet, graze to realize the greatest return.

Remember, a good pasture is a cash crop.

Choice of Seed

Field seed offered for sale in Kentucky must be accompanied by a tag on which the germination, purity, and nature of weed seed content are shown. Purchases should be made only after consideration of this information. Usually the highest quality of seed should be purchased. It generally contains fewer weed seeds per pound. Furthermore, the good seed of the crop desired will usually cost no more and may cost even less per pound of actual seed, in a purchase of high-quality seed than in a purchase of low-quality seed.

HYBRID CORN

U. S. 13 YELLOW HYBRID—A consistently high yielding and popular corn. It has very good standing ability and excellent grain quality. Pt. 25c; qt. 45c; ½ gal. 80c; gal. \$1.40; pk. \$2.45; ½ bu. \$4.75; bu. \$9.00. Postpaid, pt. 40c; qt. 65c; ½ gal. \$1.15; gal. \$1.95.

IND. 844 YELLOW HYBRID—Same maturity as U. S. 13. Popular in Southern Indiana due to Reid type, moderately low ear, stiff stalk, easy husking qualities and yielding ability. U. S. 13 will ordinarily out-yield this variety from two to five per cent. Pt. 25c; qt. 45c; ½ gal. 80c; gal. \$1.40; pk. \$2.45; ½ bu. \$4.75; bu. \$9.00. Postpaid, pt. 40c; qt. 65c; ½ gal. \$1.15; gal. \$1.95.

KY. 203 WHITE HYBRID—Rated, the highest yielding Kentucky White Hybrid. A good medium early variety with large well filled ears. The vigorous stalks are tall and show good habits of growth. Matures very uniformly. A real white hybrid corn bred in Kentucky for Kentucky farmers. Pt. 30c; qt. 50c; ½ gal. 90c; gal. \$1.60; pk. \$2.85; ½ bu. \$5.25; bu. \$10.00. Postpaid, pt. 45c; qt. 70c; ½ gal. \$1.25; gal. \$2.15.

It is giving excellent results throughout Kentucky and is growing in popularity. Pt. 25c; qt. 45c; ½ gal. 80c; gal. \$1.40; pk. \$2.45; ½ bu. \$4.75; bu. \$9.00. Postpaid, pt. 40c; qt. 65c; ½ gal. \$1.15; gal. \$1.95.

Bunton's Glorious Gladiolus

Modern-day Gladiolus far surpass the old varieties! Better colors, more open florets, larger blooms and longer spikes make them more popular than ever as a favorite for both cut-flowers and the garden.

Bunton's Glorious Gladiolus were chosen from the best exhibition varieties as listed by the Symposium of the North American Gladiolus Council. Eleven of the top winners in their respective color classes available at Bunton's include: Elizabeth the Queen, King David, Evangeline, Red Wing, Florence Nightingale, Spic and Span, Ravel, Stormy Weather, Red Charm, Spotlight and Burma.

Bunton's gladiolus are grown specifically for the finest bulbs possible. No cut-flowers have been taken from these bulbs, to hold the substance of the plant for bulb development only. Bulb size—1¼ inches and up in diameter.

For extra large blooms, plant the bulbs about two inches deep and about three inches apart in the row. The rows should be at least 12 inches apart. Gladiolus respond to plenty of water and regular feeding of a good, complete plant food such as Bunton's Lawn and Garden Grower. Weekly dusting with Bunton's 100 Garden Dust assures thrip free blossoms.

A succession of plantings at two-week intervals from April to July will give continuous bloom.

Some soils are just naturally unfriendly. They are poorly structured. Other soils, once friendly, have become structurally damaged by repeated rainfalls, crusting, baking, caking. In both cases, Krilium soil conditioner is definitely indicated. It maintains the structure of friendly soils—restores the structure of soils that have collapsed.

Here are a few cases of where and how Krilium* soil conditioner can change your "problem" soils to loose, crumbly, friendly soils—aid seed germination, emergence and plant growth!

Landscaping and Lawns

... Krilium is effective when applied to the seed-bed surface for clover, grass seed, nicotiana, petunias and others. Excellent for repairing bare and burnt spots in lawns and terraces.

Shrubs and Borders. ... Better soil structure does much to improve growth conditions for deep-rooted shrubs and borders—encourages more luxuriant foliage. Roots get more "elbow room" to spread and take hold. Apply Krilium to root depth, any time ground is workable.

Flowers and Bulbs

... Shallow-root flowers, such as asters, marigold, zinnias, flourish best in soil that has been Krilium-conditioned to a 3-inch depth. ... Plant bulbs to required depth—apply Krilium to the loose earth in the bottom of the hole before planting; also mix Krilium with the dirt to be replaced.

25 lbs. \$84.50; Postpaid \$85.50

Vegetables ... Give your vegetable garden a better growing chance by improving soil structure with Krilium. Depth of treatment depends on type of vegetables—6-inch depth is recommended for such vegetables as carrots, asparagus and tomatoes—3-inch depth is adequate for beans, radishes and the like.

Cold Frames and Seedlings

... Mix Krilium with soil to promote better germination and emergence—also improved root structure. When transplanting, apply Krilium again to encourage continued growth.

Mulching

... It is a good idea to apply Krilium before mulching; work it into soil to root depth.

Krilium Available In Handy Sizes

PREMIER PEAT MOSS

The ALL ORGANIC Soil Conditioner

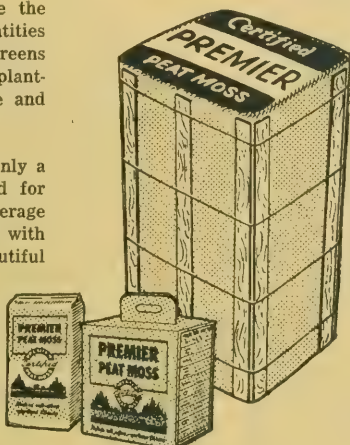

GARDENS—Peat Moss aids the gardener by improving the texture of the soil. After Peat Moss is worked into the soil the soil works easier and holds moisture longer. A one-inch layer of Peat improves the appearance of any flower garden and prohibits the growth of many weeds.

LAWNS—Many lawns suffer during hot dry periods in summer. The soil packs, becomes crusty and retards the growth of the small rootlets. Organic Peat Moss worked into the soil relieves this condition and improves the turf.

SHRUBS—Most nurserymen recognize the value of Peat Moss and work liberal quantities into the soil when transplanting evergreens and shrubs. A one-inch layer gives the planting a finished look, holds the moisture and reduces weed growth.

WINDOW BOXES, HOUSE PLANTS—Only a small quantity of Peat Moss is needed for window boxes and house plants. The average back yard soil can be improved enough with the addition of Peat Moss to raise beautiful plants.

BIRD VITA BANDS

VITA-BAND "D", the unique nutrient-treated, disintegrating plant band, controls root growth for short growing periods. Grower controls penetration of root growth through band, by cracking it at time of transplant. Band then disintegrates in the soil.

VITA-BAND "H", nutrient-treated, aids plant growth from seedling through time of transplant. At that time, this band is removed, and with normal handling, compact healthy rootball is set without transplant shock.

Bunton Trimmers TRIM-EDGE-MOW

The "DUZMORE" Bunton Trimmer

Does more than trim and edge, for it cuts the full 16½-inch width of the unit. The suction-lift blade gives a clean, smooth job, mulching and evenly distributing the cuttings.

An automatic, semi-locking caster wheel prevents scalping, makes the unit easier to handle, gives a level cut and may be quickly locked in a fixed position for trimming and edging.

Grass is directed into the blade by the pointed edger-guides, up from the sidewalks or flush markers or away from walls, monuments and trees.
